Title of project/programme

Disentangling aphasic syndromes in Alzheimer's disease

Source of funding information

NHMRC

Total sum awarded (Euro)

€ 454,775

Start date of award

01/01/16

Total duration of award in years

5.0

The project/programme is most relevant to:

Alzheimer's disease & other dementias

Keywords

alzheimer disease | neuroimaging | biomarkers | aphasia | neurocognitive assessment

Research Abstract

Alzheimer's disease, the main cause of disability in older Australians, can present with diverse and complex manifestations. Language disturbances are not entirely characterised and raises

diagnostic difficulties. By development of novel clinical tools and cutting-edge structural brain imaging, this project aims to refine the spectrum of language disturbances, analyse the pattern of brain atrophy and investigate susceptibility factors across Alzheimer's presentations.

Types:

Fellowships
