Total sum awarded (Euro)

€ 403,426

Start date of award

01/01/16

Total duration of award in years

4.0

The project/programme is most relevant to:

Alzheimer's disease & other dementias

Keywords

dementia | driving | primary care | intervention | quality of life

Research Abstract

This research addresses social, emotional and practical challenges that people with dementia face in dealing with stopping driving. A resource that provides practical and emotional support and education around stopping driving is required in primary care settings to improve quality of life of people with dementia and their carers, and support health professionals who monitor driving issues. This program will translate a research-based resource into GP clinics and community services in Australia.
